

IMPACTS OF SOLAR INVESTMENT TAX CREDIT EXTENSION¹

The proposed extension of the Solar Investment Tax Credits (ITC) for homeowners and businesses will lead to sustained growth in the U.S. solar industry. By 2020, the industry will deploy more than 20 GW of solar electricity annually and employ more than 420,000 workers. The additional solar generation will more than offset carbon emissions from the lift of the oil export ban on an annual basis by 2019.

Deployment

- The ITC extension will lead to more than 72 GW of solar photovoltaic (PV) installations from 2016 through 2020, with installations expected to continue to grow in 2021. The 72 GW over 5 years represents an increase of over 25 GW (or 54%) over baseline expectations without the extension.
- Thanks to the extension, by 2020, the U.S. will have installed approximately 98 GW of PV and 2 GW of concentrating solar power (CSP) to total 100 GW of solar electric capacity. This is enough capacity to power more than 20 million U.S. homes.
- By 2020, the U.S. will be installing 20 GW of solar capacity annually. To put this in perspective, at the end of 2014, 20 GW was the total amount of solar America had installed in its history.
- By 2020, solar will provide more than 3.5% of all U.S. electricity, up from just 0.1% in 2010, an increase of well over 3000% in just a decade.

Employment

- The ITC extension will add 220,000 solar jobs over the next 5 years
- Total solar industry employment in 2020 is expected to be 420,000 – more than double the number of solar workers today (2015).

U.S. Solar Industry Deployment and Employment

¹ SEIA analysis based on deployment data from GTM Research: <http://www.seia.org/news/investment-tax-credit-extension-will-increase-solar-investment-54-through-2020>

- The 420,000 jobs in 2020 represent 180,000 more jobs than would be expected without an ITC extension.
- The forecast of 420,000 jobs in 2020 is closing in on the projected size of the entire U.S. electric utility industry (505,000 jobs in 2024), according to Bureau of Labor Statistics².

Investment

- The ITC extension will spur an estimated \$40 billion in additional investment in the U.S. economy between 2016 and 2020, compared to baseline.
- By 2020, the U.S. solar industry is estimated to be adding more than \$30 billion annually into the U.S. economy.

Emissions³

- Assuming the lift of the oil export ban increases global CO₂ emissions by 10 million metric tons (MMT) annually (*source: Council on Foreign Relations*)⁴, the ITC extension is estimated to fully offset those additional emissions on an annual basis by 2019.
- By 2021, U.S. solar generation will offset more than 100 MMT of CO₂ annually, with roughly 25 MMT, or 25%, due to the ITC extension.
- In 2021, the 100 MMT of CO₂ offset from U.S. solar matches the emissions of 27 typical coal power plants or 20 million passenger vehicles.
